

The Tableau dashboard *Crimes Against Humanity* allows users to interact with data on crimes against humanity occurring between 2018 and 2022 provided by the Perceived Mass Atrocities Dataset (Meisel et al. 2024). A treemap outlines the regions and countries with the most common occurrences of these crimes. For more detail into specific countries, a map selector then filters for the types of crime committed and victims of the crime, presented in the form of a stacked area chart and a pie chart.

For the treemap, the size of rectangles representing the number of atrocities perceived to have been committed per million residents. Atrocities include various crimes against humanity as defined by the UN: forced conscription, mass containment, forced displacement, erasure, less-than-lethal attacks, mass murder, and reduced citizenship (Yale Genocide Studies Program, 2024). These are labeled containment, displacement, erasure, less-lethal attacks, murder, and reduced citizenship in the dashboard for conciseness. These are all crimes against humanity because they involve purposeful destruction of a people group through inflictions on the conditions of their life. The data was summed to create the main measure for this dashboard, atrocity magnitude. The wording “perceived” is used because often atrocities are disputed in an authoritative manner (Meisel et al., 2024). This highlights a key challenge in data collection for crimes against humanity: state actors vehemently deny and often engage in disinformation campaigns to, avoiding responsibility for their actions (Sudworth, 2021). This links to the rational model of crime discussed in class. If there is no risk to be prosecuted, there will simply be no deterrence to crime, and rational state criminals are therefore incentivized to continue committing them (Becker, 1974).

Below the treemap is a stacked area chart, which shows changes in the occurrence of crime over time. Often, magnitude of these crimes can spike because of events such as conflict or legislative

change. A common type of atrocity is displacement, where residents are forced to leave their home due to some sort of status. In this case, displacement is sponsored by the state to make room for settlers, such as the Israeli settlement of the West Bank (Al Jazeera, 2026). An example of, for purposes of war, such as Russian forced evacuations of Ukrainian civilians (OECD, 2026). Furthermore, displacement triggers long term negative social, economic, and health consequences by removing people groups from their established property, shredding community ties and shared history. Like terrorism discussed in class, often individual cases of displacement have larger impacts on civilian populations because it adds a mental toll to individuals not yet impacted, as well as driving them to self-displace. This forms an extra benefit to the criminals, further incentivizing them to commit more of these atrocities. This highlights the importance of International bodies like the International Court of Transitional Justice. The court which supposedly has international jurisdiction is making efforts to clarify these acts as humanitarian crimes, allowing for future prosecution and deterrence (Andreu-Guzmán, 2013).

Next to the stacked area chart lies the pie chart, which highlights the distribution of atrocity types, or crimes against humanity, in selected countries. Furthermore, tooltips reveal the perpetrator and victim of crimes. Common perpetrators include national police, terrorist groups, and even ethnic mobs. Victims are often targeted because of their political status or religious beliefs. As shown in the pie chart, countries with a lot of atrocities have reduced citizenship or displacement as the most common crimes committed. Reduced citizenship crimes involve stripping rights from longtime residents, creating a second-class citizenship with less rights and benefits due to some sort of ancestry. These are considered crimes against humanity because they render residents' refugees in their own country, with no "home" to ever enjoy full rights as human beings (Worster, 2019). However, like displacement, reduced citizenship is often ignored

by international criminal justice bodies, in large part because the actor is most commonly state level, therefore generally having sovereignty over who to consider a citizen (Baughman, 2026).

In conclusion, the *Crimes Against Humanity* dashboard outlines the countries with most egregious occurrences of atrocities against victim groups, as well as the types of crime and chronological progression of occurrences. These visualizations shine light on egregious acts of physical or mental violence that either legitimate or proclaimed state actors place upon their own subjects. Optimally, those driving these actions deserve prosecution and final reckoning with real consequences.

Appendix

Dashboard:

Crimes against humanity (atrocities) are campaigns against the conditions of life for civilian victim groups. Unlike most crimes, crimes against humanity are often state sponsored, increasing difficulty of prosecution as deterrence.

This dashboard sheds some light to the serious current situation in crimes against humanity. Note that as many crimes are controversial and subjective, these crimes are noted as perceived. Nonetheless, stringent evidence was required for addition to this database, and most cases are to be trusted. Also note that the database tracks atrocities based on the country crime is committed, rather where the perpetrator is based. Atrocity names have also been shortened for conciseness. They are, in order as appear on the filter: forced conscription, mass containment, forced displacement, erasure, less-than-lethal attacks, mass ..

All

Data collected from 2018-2022, sourced from the perceived mass atrocities database at www.prio.org/journals/jpr/repli..

Above is a tree map of crimes against humanity by region, highlighting the distribution of atrocities around the world. Click on the blocks to locate the countries on the world map. Click on the map to filter for them in the charts below.

More detail on those crimes can be found in the pie chart and stacked area chart below. Use either the map or country search tool to identify a specific country to analyze.

The pie chart outlines the types of crimes against humanity experienced in the selected country. Hover above for tool tips highlighting perpetrators and victims. The stacked area chart to its right represents the changes in types of crime over time, which sheds light to how potential events such as civil war or crackdowns on democracy significantly impact the types and amount of crimes against humanity committed.
